

**March 10 Q&A Continued:**

1) Do you plan to continue hosting your mapping service?

The preference would be to host it in-house but open to other options.

2) Is your staff trained with MapServer or other Open Source technologies?

No we are not and would like to be trained for maintenance.

3) What do you have your MapServer running on? From what I have seen I am guessing Windows. (Windows, Linux, Mac)

Windows

4) When allowing other programs to connect to the data do you mean with Features or just an image? (WFS/WMS)

Please See:

Additional information from our Information Services Department can be found [here](#).

5) When allowing MapServer to connect to SDE or ArcServer do you want to use images or features? (WMS/WFS)

Both would be nice but have the images in sid format.

6) How do you want users to access the hyper-linked images (tie-sheets etc)? Will these be represented by points on the map?

Through the web mapping application. These are points or polygons on a map with a hyper link field.

7) Which map service do each of these apply too?

Tie sheet – Survey Viewer

Survey Control – Survey Viewer

Unrecorded Maps – Survey Viewer

Photos – Shore Viewer

Parcel Maps – Parcel Viewer

8) When creating a separate site quickly, are you planning to have the contractor put that up for you or do you want the ability to do it?

We would like the ability to do this but would be open for someone to do this.
